

WS3: An open-source Python framework for integrated simulation and optimization of forest landscape and wood supply systems

Open Forest Inputs

Import Woodstock-format inventories and policy constraints; scripted preprocessing keeps data provenance auditable.

Open Code

Open and flexible modelling framework allows representation of a wide range of forest ecosystem types and management policy options.

Solver-Backed Scheduling

Run deterministic Modell optimization alongside libCBM to quantify harvest, stocks, and GHG outcomes within one reproducible stack.

Outputs & Spatial Products

Export tables, figures, and raster allocations that expose policy trade-offs and are easy to rerun or extend.

WS3 delivers a transparent, end-to-end workflow for climate-aware wood supply planning across Canada and beyond.
